CLACKAMAS COMMUNITY COLLEGE  
MARCH 29, 2017**

ENVIRONMENTAL SERVICES  
CITY OF PORTLAND

**CURRIE WAS EXAMINING DATA FROM RADIOCHEMISTRY. THE DETERMINATIVE TECHNIQUE HAD THE ABILITY TO GIVE POSITIVE AND NEGATIVE NUMBERS. FOR A BLANK:**

HE CALLED THE POINT WHERE THE CHANCE OF A RANDOM FALSE POSITIVE WAS  $\leq 1\%$  THE CRITICAL LEVEL.

**THE SAME BELL-SHAPED DISTRIBUTION WILL  
OCCUR WHEN ANALYZING A SAMPLE MANY  
TIMES.**

**THE “TRICK” IS TO FIND OUT HOW LOW YOU  
CAN GO BEFORE YOU START COUNTING NOISE  
AS ANALYTE.**

**CURRIE SHOWED IT GRAPHICALLY LIKE THIS...**

**DATA FROM  
RUNNING A  
BLANK  
MANY  
TIMES**

**DATA FROM RUNNING A  
LOW-LEVEL SAMPLE MANY  
TIMES**

**GOAL IS TO SET  
PEAK SO THAT  
THERE'S ONLY  $\leq 1\%$   
CHANCE THAT  
YOU'RE COUNTING  
NOISE AS SIGNAL!**

# CURRIE CALLED THIS LOWER VALUE FOR SAMPLES THE DETECTION LIMIT.

**IMPORTANT POINT TO REMEMBER:**

**CURRIE'S APPROACH WAS TO**

**MINIMIZE FALSE POSITIVES**

**YOU CAN CALCULATE CURRIE'S CRITICAL  
VALUE AND OTHER PARAMETERS BECAUSE THE  
NORMAL DISTRIBUTION IS WELL-  
CHARACTERIZED...**

$$y = \frac{1}{\sqrt{2\pi}} e^{-(x-\mu)^2/2\sigma}$$

---

$\mu$  = Mean

$\sigma$  = Standard Deviation

$\pi \approx 3.14159$

$e \approx 2.71828$

CURRIE ALSO CAME UP WITH THE IDEA OF A **QUANTITATION LIMIT.....**

BASICALLY, IT WAS AN ATTEMPT TO MOVE THE DETECTION LIMIT HIGHER UNTIL THE CHANCE OF A FALSE POSITIVE APPROACHED ZERO.

ALTHOUGH BACKED BY A LOT OF STATISTICS, THE FINAL RESULT WAS SIMPLE:

$$QL = 10s$$

WHERE **S** = THE STD. DEV. FROM THE ANALYSIS OF A BUNCH OF LOW-LEVEL SPIKED BLANKS.

WHAT CURRIE WAS GETTING AT IS ILLUSTRATED IN THE FOLLOWING GRAPH.....

# NOTE WHERE CURRIE'S QL APPROACHES ZERO ON THE DOWN SIDE ( ↓ )

# THIRTEEN YEARS LATER, THE EPA GOT INTO THE ACT WITH A PAPER OUT OF THE EPA EMSL LAB IN CINCINNATI, OHIO

## GLAZER *et al.* 1981. *ENV. SCI. & TECHN.* 15: 1426-1435.

### Trace analyses for wastewaters

*Method detection limit, a new performance criterion for chemical analysis, is defined as that concentration of the analyte that can be detected at a specific confidence level, with a given and specified analytical method, for reliable wastewater analyses of existing pollutants*

John A. Glazer  
David L. Lauer  
Cynthia R. Glazier  
Stephen R. Glazier  
William R. Fields  
Environmental Monitoring and  
Systems Laboratory  
Cincinnati, Ohio 45268

The development of trace analytical technology brought with it a new question: what level of sensitivity is needed to detect and identify pollutants at trace concentrations? The Environmental Monitoring and Systems Laboratory (EMSL) in Cincinnati is currently developing and testing procedures for the measurement of potential pollutants at trace concentrations in general and industrial wastewaters.

A list of pollutants has been compiled for the Federal Reporting Requirements of the 124 priority pollutants. These pollutants are divided into a number of categories based on their physical and chemical properties: acids, bases, metals, pesticides, and other organic and inorganic compounds. The list of pollutants is divided into two categories: "priority" and "other".

The "priority" pollutants are those that are listed in the Federal Reporting Requirements and are subject to the most stringent monitoring requirements. The "other" pollutants are those that are not listed in the Federal Reporting Requirements but are still subject to monitoring requirements.

To ensure proper monitoring and reporting of pollutants, the EPA has established a method detection limit (MDL) as a performance criterion for chemical analysis.

Method detection limit (MDL) is defined as that concentration of the analyte that can be detected at a specific confidence level, with a given and specified analytical method, for reliable wastewater analyses of existing pollutants.

Method detection limit (MDL) is defined as that concentration of the analyte that can be detected at a specific confidence level, with a given and specified analytical method, for reliable wastewater analyses of existing pollutants.

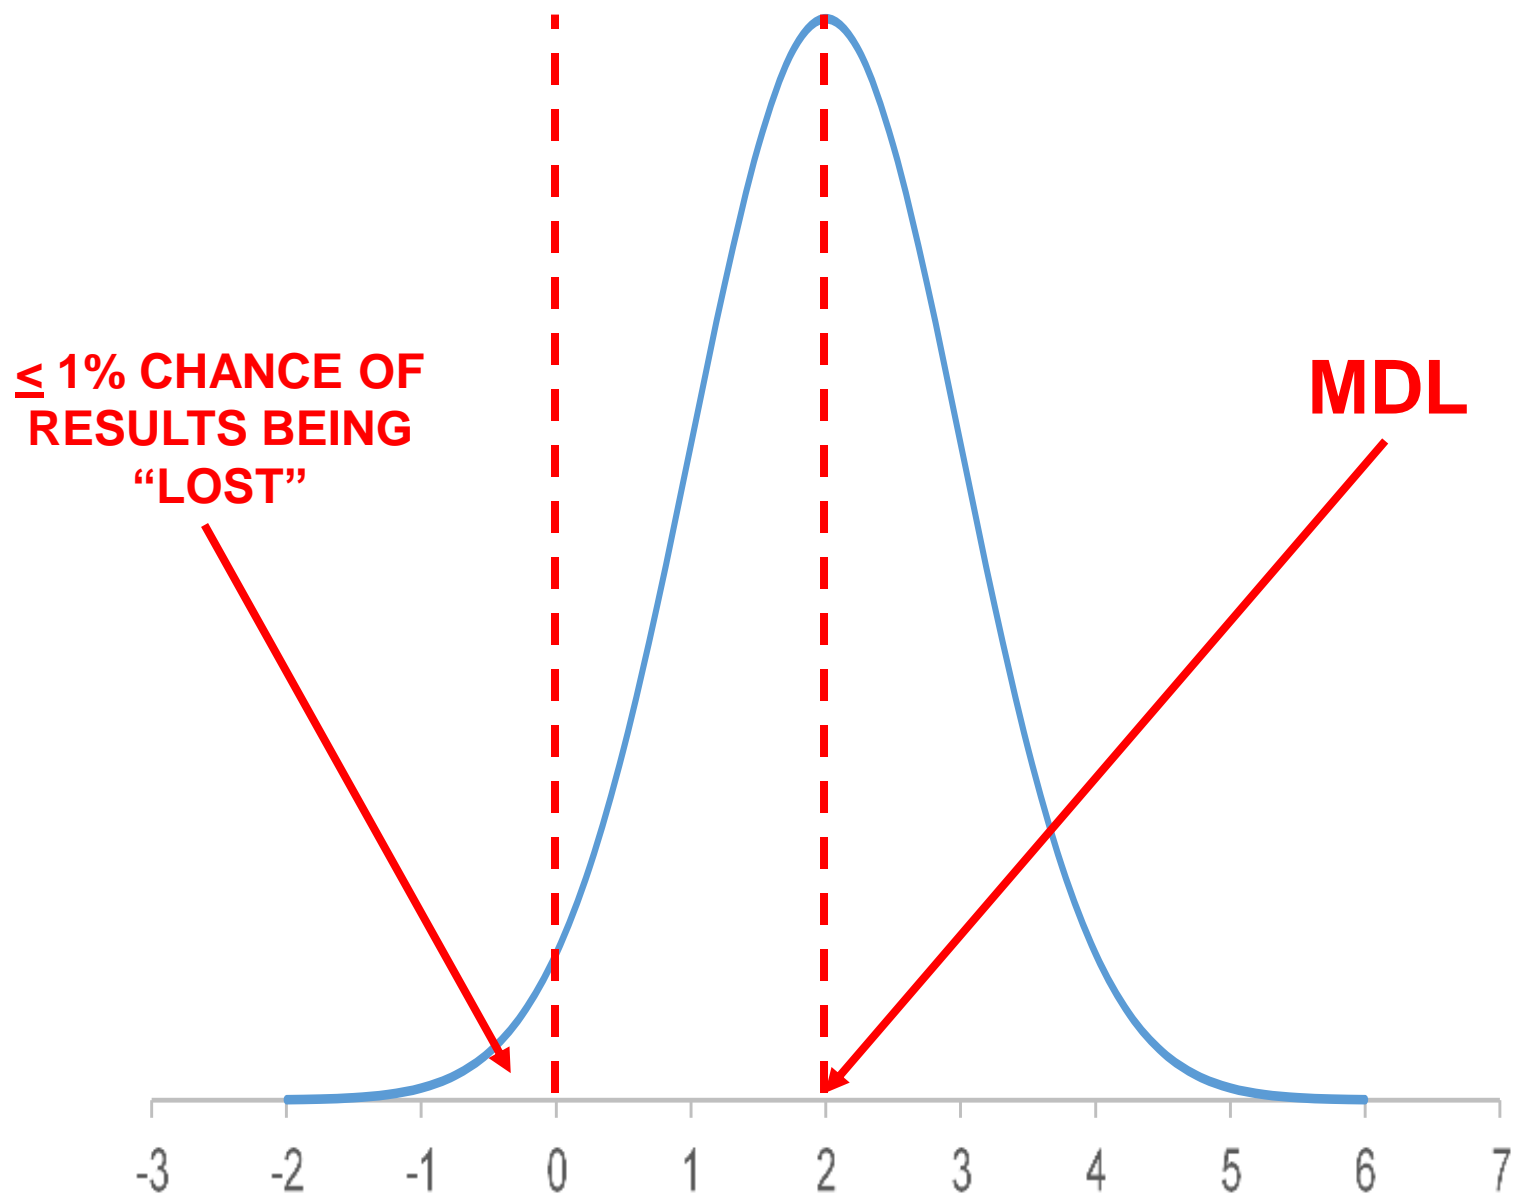

Method detection limit (MDL) is defined as that concentration of the analyte that can be detected at a specific confidence level, with a given and specified analytical method, for reliable wastewater analyses of existing pollutants.

Method detection limit (MDL) is defined as that concentration of the analyte that can be detected at a specific confidence level, with a given and specified analytical method, for reliable wastewater analyses of existing pollutants.

**THEY WERE LOOKING AT 15 ORGANICS  
METHODS (GC, GC/MS, AND HPLC) FOR THE  
NPDES PROGRAM (WASTEWATER &  
INDUSTRIAL PRETREATMENT).**

**THESE METHODS DON'T GENERATE NEGATIVE  
NUMBERS.**

**SO THE EPA WANTED TO SET A LIMIT TO AVOID  
POSITIVE RESULTS "FALLING OFF THE CURVE"  
SO TO SPEAK.**

**THREE YEARS LATER, THE EPA PROMULGATED  
THIS NEW MDL CONCEPT AT  
40 CFR 136 ON OCTOBER 26, 1984**

**AS A REGULATORY OPTION**

**THE CALCULATION IS VIA THE WELL-KNOWN  
EQUATION**

$$\text{MDL} = ( t_{n-1, 1-\alpha = 0.99} ) \bullet S_n$$

**IMPORTANT POINT TO REMEMBER:**

**THE EPA'S APPROACH WAS TO**

**MINIMIZE FALSE NEGATIVES**

**WHERE CURRIES' APPROACH WAS TO**

**MINIMIZE FALSE POSITIVES**

WHEN YOU COMPARE THE EPA MDL WITH CURRIE'S DL, EPA MDL HAS A SIGNIFICANT POTENTIAL FOR INCLUDING NOISE IN THE SAMPLE SIGNAL  
THIS WAS NOT CONSIDERED WHEN DEVELOPING THE MDL!!

(AREA ★ BELOW)

**IN OTHER WORDS, THE EPA MDL COULD COUNT NOISE AS A POSITIVE “HIT”**

**THIS IS CALLED A TYPE I ERROR AND IS A BIG CONCERN FOR ANY REGULATED ENTITY THAT COULD BE FINED OR SHUT DOWN BECAUSE OF “FINDING” CONTAMINANTS IN THEIR DICHARGE(S).**

**BUT...**

**THE NEW EPA MDL PROCEDURE WAS SO EASY, IT WAS PICKED UP FOR ALL KINDS OF ANALYSES BY....**

**EPA OGWDW (GROUND & DRINKING WATER)**

**EPA OSW (SOLID WASTE)**

**EPA OERR (EMERGENCY & REMEDIAL RESPONSE)**

**STANDARD METHODS**

**AND EVEN ASTM**

**LIFE WAS TRULY GREAT FOR THE EPA AND  
EVERYBODY ELSE.**

**AND EVERYBODY IGNORED THE ISSUE OF  
CURRIE'S CRITICAL VALUE.**

**THAT IS, UNTIL THE EPA **PROMULGATED** ITS MDL  
PROCEDURE AT THE SAME TIME AS ITS NEW,  
LOW-LEVEL MERCURY METHOD ON JUNE 8,  
1999....**

**AND MADE IT GENERAL FOR ALL  
EPA METHODS**

**(BIG MISTAKE.....)**

**BECAUSE IT GOT**

**PROMPTLY SUED !!!**

**BY...**

**THE ALLIANCE OF AUTOMOBILE MANUFACTURERS**

**THE CHEMICAL MANUFACTURERS ASSOCIATION**

**THE UTILITY WATER ACT GROUP**

**THE AMERICAN FOREST & PAPER ASSOCIATION**

**FOR REQUIRING THE MDL PROCEDURE TO BE USED FOR  
INAPPROPRIATE METHODS (E.G., METALS)**

# THE QUEST FOR THE HOLY GRAIL OF A UNIVERSALLY APPLICABLE MDL PROCEDURE HAD BEEN GOING ON AND CONTINUED TO GO ON FOR THE NEXT 16 YEARS!!

## AND EVERYBODY GOT INTO THE ACT:

- ML:** EPA METHODS 624, 1624, 625, 1625 (1980 – 1984)
- REVISED MDL:** EPA METHOD 1631B (1999)
- PQL:** EPA DRINKING WATER PROGRAM (1987)
- EQL:** EPA OFFICE OF SOLID WASTE (LATE 1980s)
- LCMRL:** EPA DRINKING WATER PROGRAM (2006)
- CRDL/CRQL:** EPA SUPERFUND CONTRACT LAB PROGRAM (??)
- CMDL/CMQL:** EPRI (1993)
- AML:** ACADEMIA (1997)
- IDE/IQE:** ASTM (2007)
- LOD/LOQ:** AMERICAN CHEMICAL SOCIETY (1983)
- RDL/RQL:** AMERICAN CHEMICAL SOCIETY (WITHDRAWN)
- DL CASE I/DL CASE II:** ACIL (2003)
- LT-MDL:** USGS (1999)

THE EPA CONVENEED THE FEDERAL ADVISORY COMMITTEE ON DETECTION AND QUANTITATION (OR *FACDQ* FOR SHORT). THE WORK GROUP CAME UP WITH THE “DQFAC METHOD” AND SENT IT TO EPA IN DECEMBER 2007, EIGHT YEARS AFTER THE EPA HAD BEEN SUED.

THE EPA DECIDED THE PROPOSED MDL PROCEDURE WAS TOO CUMBERSOME, AND IT WAS PROMPTLY

**REJECTED !**

**THE NELAP INSTITUTE (TNI)  
CHEMISTRY EXPERT COMMITTEE  
DEVELOPED A NEW MDL  
PROCEDURE UNDER CONTRACT TO  
THE EPA AND SENT THE DRAFT TO  
THE EPA ON MARCH 19, 2014**

**EPA PROPOSED THE NEW TNI MDL METHOD IN ITS LATEST METHOD UPDATE RULE THAT WAS PROPOSED ELEVEN MONTHS LATER IN FEBRUARY 2015.**

**THIS UPDATE WAS SIGNED BY THE EPA ADMINISTER ON DECEMBER 15, 2016.**

**THEN IN JANUARY, PRESIDENT TRUMP SIGNED AN EXECUTIVE ORDER FREEZING SPENDING, AND THE FEDERAL REGISTER CEASED PUBLISHING.**

**.....WE'RE STILL WAITING.....**

## FEDERAL REGISTER

Vol. 80

Thursday,

No. 33

February 19, 2015

Part II

Environmental Protection Agency

40 CFR Part 136

Clean Water Act Methods Update Rule for the Analysis of Effluent;  
Proposed Rule

# IN A NUTSHELL, THE PROPOSED MDL PROCEDURE IS:

- 1) ANALYZE A BUNCH OF BLANKS AND SPIKED BLANKS
- 2) CALCULATE THE INITIAL MDL ( $MDL_s$ ) USING THE SPIKES
- 3) IF NO BLANKS CAME UP POSITIVE, DISCARD THE BLANK DATA
- 4) IF THERE ARE SOME POSITIVE BLANKS, THE  $MDL_b$  IS THE HIGHEST BLANK  
(IF YOU HAPPEN TO HAVE > 100 BLANKS (!), SET THE  $ML_b \geq$  THE 99<sup>TH</sup> PERCENTILE)
- 5) IF ALL OF THE BLANKS ARE POSITIVE, CALCULATE THE  $ML_b$  JUST LIKE THE  $MDL_s$
- 6) YOUR INITIAL MDL IS WHICHEVER IS GREATER: THE  $ML_s$  OR THE  $ML_b$ .

**TNI MDL PROCEDURE ADOPTED BY THE  
EPA AND PROPOSED IN THE 2/29/15  
METHOD UPDATE RULE FOR 40 CFR 136  
APPENDIX B...**

**DOES NOT INCLUDE QLs!**

**HOWEVER, TNI DID INCLUDE A QL  
PROCEDURE IN THEIR PROPOSED NEW  
STANDARD**

- **SELECT A TRIAL QL  $\geq$  3x WHAT YOU GUESS YOUR MDL WILL BE**
- **THE TRIAL QL HAS TO BE  $\geq$  YOUR LOWEST CAL STANDARD**
- **PROCESS THREE SETS OF  $\geq$  7 BLANKS AND BLANKS SPIKED AT THE TRIAL QL LEVEL THROUGH ALL STEPS OF THE METHOD, EACH SET RUN ON A SEPARATE DAY**
- **CALCULATE THE MDL<sub>s</sub> AND MDL<sub>b</sub> AND CHOOSE**
- **IF THE TRIAL QL  $\geq$  MDL, QL = SPIKE LEVEL  
IF THE TRIAL QL < MDL, QL = 3x MDL**

## JUST SIX MONTHS LATER (8/13/15), EPA OSW PUBLISHED FINAL UPDATE V OF THE SW-846 COMPENDIUM...

- THE MDL WAS LITERALLY SCRAPPED AND REMOVED FROM CHAPTER ONE (QUALITY CONTROL)
- IN IT'S PLACE WAS PUT THE LLOQ, LOWER LIMIT OF QUANTIATION
- "...THE LOWEST POINT OF QUANTITATION, WHICH IN MOST CASES IS THE CONCENTRATION OF THE LOWEST CALIBRATION STANDARD IN THE CALIBRATION CURVE..."
- "AS THE REGULATONS ARE REVISED, THE RCRA PROGRAM WILL REMOVE THE MDL REFERENCE FROM THE MDPs [METHOD DEFINED PARAMETERS] AND REPLACE IT WITH THE LLOQ CONCEPT [sic] WHERE APPROPRIATE."

**NO STEP-BY-STEP PROCEDURE IS GIVEN! YOU HAVE TO LOOK THROUGH VARIOUS SECTIONS OF CHAPTER ONE:**

- FIRST, THERE HAS TO BE A “DECISION LEVEL” OR “REGULATORY ACTION LEVEL”. (AN EXAMPLE OF THE LATTER IS A STATE WATER QUALITY STANDARD.)**
- CONSTRUCT YOUR CAL CURVE SO THAT YOUR LOWEST, NON-ZERO STANDARD IS AT OR BELOW THIS LEVEL.**
- TEST YOUR CHOICE BY RUNNING WHAT IS ESSENTIALLY A LOW-LEVEL ICV AT THIS CONCENTRATION. INITIAL CONTROL LIMITS ARE  $\pm 20\%$  RECOVERY. CAN SET YOUR OWN AFTER DOING A LOT OF ANALYSES.**
- IF THE ABOVE ARE SATISFIED, YOU HAVE YOUR LLOQ. IF NOT, YOU’LL HAVE TO RAISE YOUR CAL CURVE  $\Rightarrow$  ITERATIVE PROCESS.**

# HERE'S WHAT TO DO RIGHT NOW:

- 1) USE 40 CFR 136 FOR MDL (CURRENT VERSION, **NOT** “REVISION 2” BECAUSE IT’S NOT FINAL)
- 2) USE DEQ/STD. METHODS/CURRENT TNI FOR QL: THE LOWEST STANDARD USED IN A VALID CAL CURVE
- 3) KEEP A CLOSE EYE ON SW-846 METHOD REVISIONS AND SWITCH TO THE LLOQ WHEN CALLED FOR. **NOTE THAT THIS SHOULD BE THE SAME AS THE QL IN #2, ABOVE!**

*The End*
